

Mycorrhizal symbiosis of European larch (*Larix decidua*)

from seedlings to mature trees

Maria Rudawska, Tomasz Leski

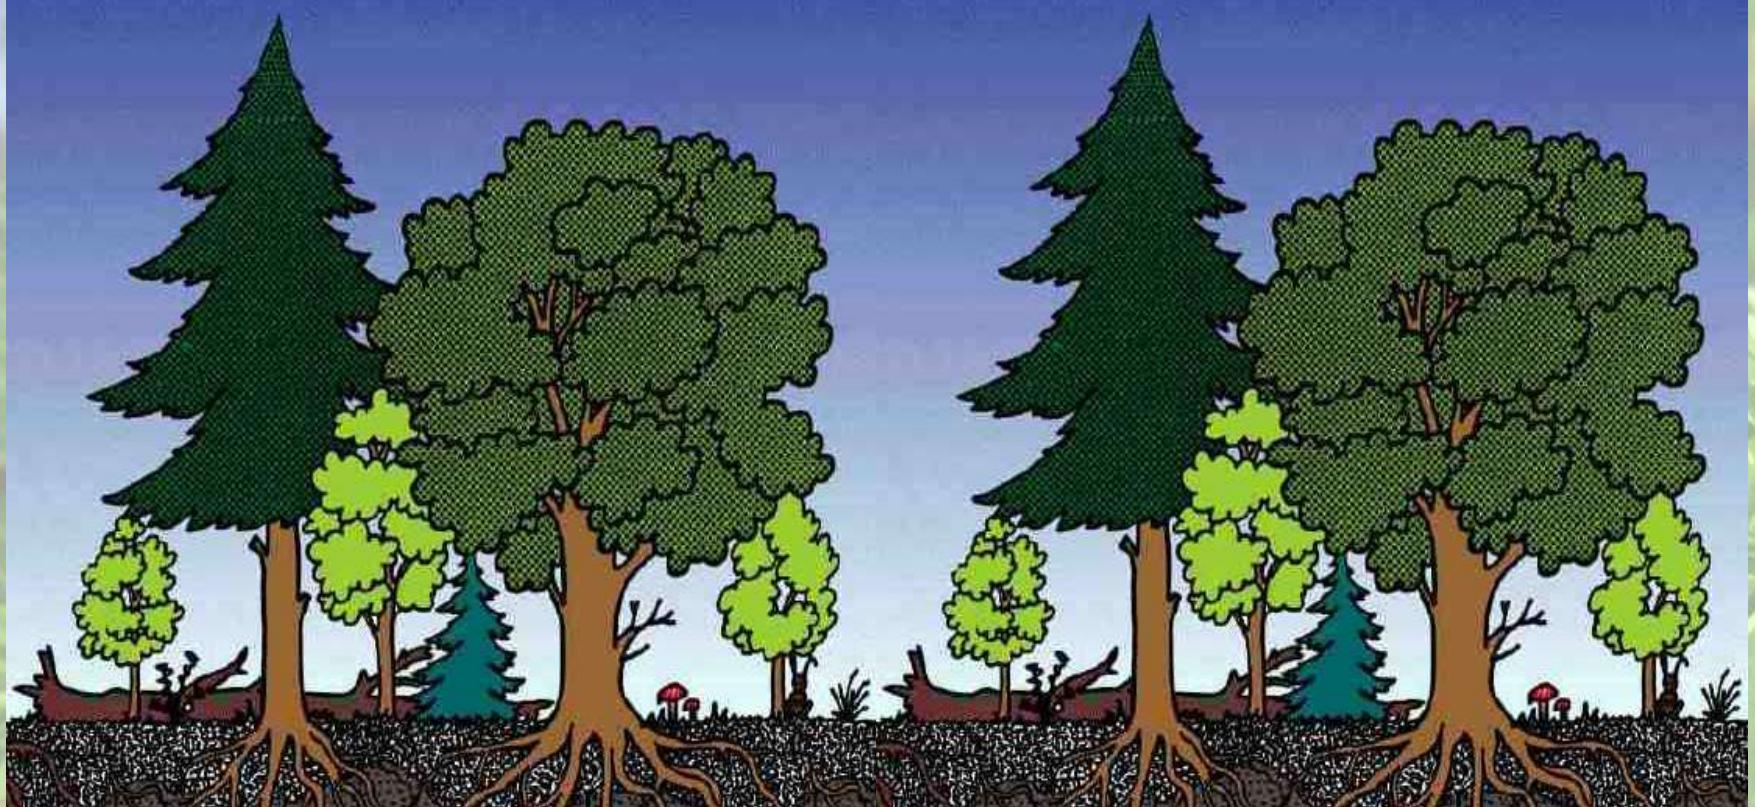

Larch in a warm climate

Most higher plants do not have (fine) roots, they have mycorrhizas

M. Begon, J. L. Harper & C. R. Townsend; Ecology, Blackwell Scientific Publications, Oxford 1986

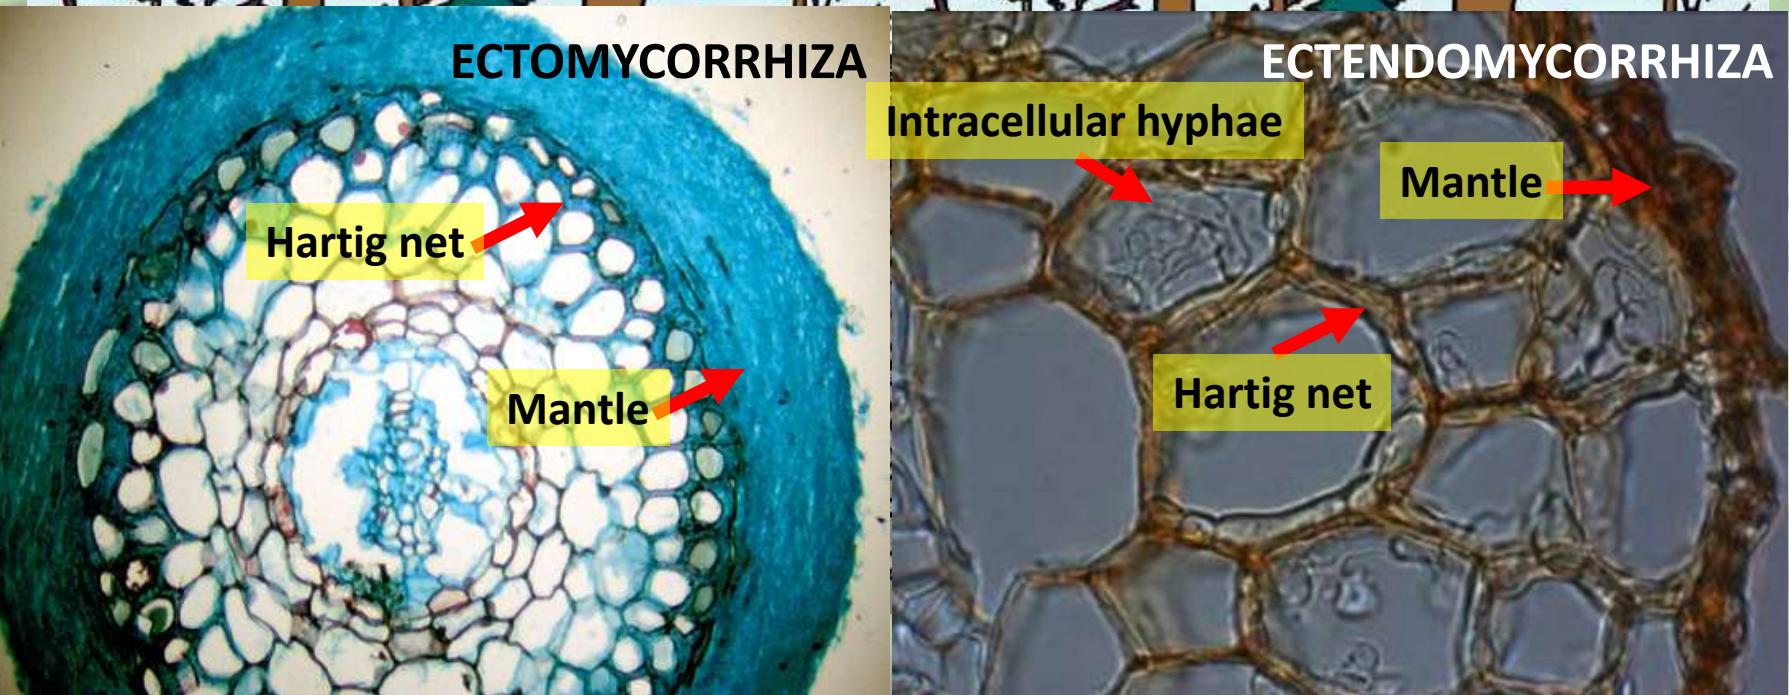

Definition of mycorrhizae:

**Mycorrhiza is a symbiotic mutualistic relationship between plant roots and fungi
(myco = fungus, rhiza = root)**

Types of mycorrhizae:

- Arbuscular
- Ectomycorrhizae ←
- Ectendomycorrhizae ←
- Arbutoid
- Monotropoid
- Ericoid
- Orchid

Research on larch mycorrhiza

ECM FUNGAL COMMUNITY OF EUROPEAN LARCH IN THE TATRA MOUNTAINS

Thanks for your attention

Greetings from Kórnik

ANOSIM (analysis of similarities) and NMDS (non-metric multidimensional scaling)

Comparison of taxonomic composition of the ectomycorrhizal community among both sites was also calculated using the Bray–Curtis dissimilarity coefficient which has been shown to be one of the most robust coefficients for the analysis of taxonomic composition data.

To test the significance of taxonomic differences due to location the Bray–Curtis matrix was subjected to the simple non-parametric permutation procedure - analysis of similarities (ANOSIM).

The R value in ANOSIM is equal to 1 if there is a complete separation of groups and 0 when groups are similar and has a measure of statistical significance (P) attached to it.

Non-metric multidimensional scaling (NMDS) is an effective method available for the ordination of taxonomic composition data and provided a visual summary of the pattern of Bray–Curtis values for the comparison of ectomycorrhizal fungal composition on tested sites.

PODSUMOWANIE

- ❖ Zbiorowiska grzybów ektomikoryzowych towarzyszących modrzewiowi zmieniają się w układzie chronosekwencji stanowisk
- ❖ Wysokość nad poziomem morza tylko w niewielkim stopniu kształtuje zbiorowiska grzybów ektomikoryzowych towarzyszących modrzewiowi
- ❖ Sezon w istotnym stopniu modyfikuje bogactwo gatunkowe grzybów mikoryzowych towarzyszących modrzewiowi (Góry Izerskie)

- ❖ Naturalnie odnawiające się siewki modrzewia mogą być traktowane jako „naturalne pułapki” na grzyby ektomikoryzowe

Research potential of Institute of Dendrology in forest ecosystem genomics

INSTITUTE OF DENDROLOGY

Polish Academy of Sciences

The Institute of Dendrology is a Polish unique centre of multidisciplinary research on trees and shrubs.

INSTITUTE OF DENDROLOGY

The history of the Institute goes back to the early 19th century. In 1829-1880 Tytus Działyński and his son, Jan Kenty Działyński, created a rich collection of woody plants, which later developed into the Kórnik Arboretum, closely associated with the Institute.

INSTITUTE OF DENDROLOGY

In 1933 the Department of Dendrology was established as a part of the Kórnik Gardens owned by the Foundation 'Zakłady Kórnickie'. In 1945, after the end of the 2nd World War, the research centre was restored as the Department of Dendrology and Pomology. It was affiliated to the Polish Academy of Sciences in 1952, and its name had changed several times by 1975, when it became the Institute of Dendrology.
